

# Argentine Bahia Grass

Argentine Bahia has wider broader leaves with a good darker green color than Pensacola. It is a more desirable turf than Pensacola but is more susceptible to the cold weather with a higher chance for winterkill. It is used very commonly for lawns, because of its attractive look and the fact that it produces less seed heads than Pensacola.

Argentine Bahia can also be used in coastal areas for pasture. For coastal regions it is a better choice than Pensacola because of its ability to stand better than Pensacola in wetter conditions.

Argentine Bahia grass is an excellent choice for both turf and pastures because it is relatively easy to maintain. It is very drought tolerant and will easily survive with little maintenance. It is commonly used in the Southeastern United States and is recommended for areas with similar climatic conditions.

**New Lawns** - Plant 5 to 10 lbs. per 1000 sq. ft.

**Pasture Applications:** Plant 25 to 100 lbs. per acre.

\*The more seed applied to the lawn or pasture on the first planting the faster the lawn or pasture will fully establish a sod or grass base and prevent future overseeding to fill in bare spots.
